## ZINC OXIDE VARISTOR SELECTION (ONLY REFERENCE)

Varistor voltage

Varistor voltage should be more than the operating voltage in over-voltage protective circuit The formula is shown as the following:

$V1mA+a.v/b.c$

a-power Voltage ripple coefficient usually take 1.2

v-DC Voltage (significant value only AC power)

b-Tolerance usually take 0.85

c-Ageing coefficient usually take 0.9

The calibrated Value is 1.5 times of DC voltage, the face value should be  $\sqrt{2}$  times of the calibrated value because of the peak voltage in alternating current power.

Withstanding surge current

In general, withstanding surge current is max. Pulse current value which determined by test conditions such as wave-shape, shock times and interval time etc, the change ratio of Varistor Voltage should be less than  $\pm 10\%$  of the initial Value. The shock time is the function of wave - shape, amplitude and interval time ,when the amplitude decrease to 50% of the initial, it should be increased to 2 times of the initial in order to keep the life longer, the surge current which is absorbed by the varistor should be less than max. Withstanding surge current.

### GENERAL TYPE DIMENSIONS

General type is widely used in surge protection for IC. diode. trial semiconductor, thyristor, consumer, military industry telecommunication measuring & controlling instrument etc.

### LIGHTNING ARRESTER TYPE

Lightning arrester type is ideal for semiconductor, signal relay, telecommunication, calibrating equipment, communication inter-medium station, distribution board, surge absorption and lightning-protection of all sorts of electric equipment because of the properties, with the Great withstanding surge current, wide voltage, quick responding speed and low residual voltage etc.
